European seasonal and annual temperature variability, trends and extremes
since 1500. Science, 303, 1499-1503.

ABSTRACT (Xoplaki et al. 2005):

We evaluate variability, trends, uncertainties, and change of extremes
of reconstructed and observed European spring and autumn temperature
back to 1500. Spring and autumn temperature experienced systematic
century-scale cooling compared to present conditions. The coldest
springs appeared during the Maunder Minimum (DT = -1 K wrt 1901-2000).
The amplitude of spring temperature variations at decadal and multidecadal
scales doubles that of autumn and is most expressed in northeastern Europe.
The decade 1995-2004 was very likely the warmest of the last half millennium.
Anomalously warm springs and autumns have generally become more extreme
in recent decades. However, the recent changes are statistically not
significant with respect to the pre-industrial period.

ABSTRACT (Luterbacher et al. 2004):

Multiproxy reconstructions of monthly and seasonal surface temperature
fields for Europe back to 1500 show that the late 20th- and early
21st-century European climate is very likely (>95% confidence level)
warmer than that of any time during the past 500 years. This agrees with
findings for the entire Northern Hemisphere. European winter average
temperatures during the period 1500 to 1900 were reduced by ~0.5°C
(0.25°C for annual mean temperatures) compared to the 20th century.
Summer temperatures did not experience systematic century-scale cooling
relative to present conditions. The coldest European winter was 1708/1709;
2003 was by far the hottest summer.

GEOGRAPHIC REGION: Europe
 PERIOD OF RECORD: 1500-2004 AD

DESCRIPTION:

Seasonal averaged European land (25W-40E; 35N-70N) absolute surface air temperature 1500-2004. Data from 1500-1900 are reconstructions.

Reference for Winter and Summer data: Luterbacher et al. 2004

Reference for Spring and Autumn data: Xoplaki et al. 2005

References for Annual data: Xoplaki et al. 2005 and Luterbacher et al. 2004

Data from 1901-2002 are taken from: Mitchell and Jones 2005

Data from 2003-2004 stem from: Hansen et al. 2001

Note that the winter and summer reconstructed values are slightly different from Luterbacher et al. (2004) for earlier centuries because the reconstructions have been redone (i) fitting to Mitchell and Jones (2005) observational data rather than New et al. (2000), (ii) using only instrumental temperature series and temperature-sensitive documentary and natural proxies, and (iii) including a few more instrumental series compared to Luterbacher et al. (2004).

The files in the /europe-seasonal-files directory located with this readme file contain seasonal data for a given year.

They are named with the year and then a two-letter code to indicate the season.

su = summer

au = autumn

wi = winter

sp = spring

The first row of data in the files is the northernmost row(70N) with data values going from West to East in each row. The rows then proceed from North to South.

DATA:

Column 1: Year AD

Column 2: Winter (December-January-February) averaged absolute surface air temperature, °C

Column 3: Spring (March-April-May) averaged absolute surface air temperature, °C

Column 4: Summer (June-July-August) averaged absolute surface air temperature, °C

Column 5: Autumn (September-October-November) averaged absolute surface air temperature, °C

Column 6: Annual averaged absolute surface air temperature, °C
